---	---------------	---

### **General**

System FLUIDO has been developed around and expressly for the QMatic SOLO LINEA queue management system to make the customer's call to cashier fully automatic, without having to wait for the manual action of the cash operator.

This allows more speed in serving customers and increase their in store experience !

FLUIDO levels the "dead time" between one call and the next, balancing the calls for all the open cashiers and equally distributing the work for all the cash operators.

Over one year and several plants working in big and small markets are the business card of FLUIDO.

### **Easy to sell Easy to install Easy to maintain**

FLUIDO directly connects to the QMatic SOLO LINEA system simply adding one or two 8I/O Qmatic INTERFACE MULTI I/O \* 8 + RF-MOD.433MHZ depending on the number of installed cashiers. Finally, by modifying a configuration file in the SOLO LINEA unit the integration with the FLUIDO is completed. To achieve the best reliability and to facilitate installation by technicians, FLUIDO works in parallel to the SOLO LINEA system with a single cable network using the same cabling system as SOLO LINEA and the same, but separate, 24Vdc power supply. Flexible: a set of parameters and sensors permits to adapt it to the customer's need .It can be switched from automatic call mode to manual call mode at any time with a simple switch.

System FLUIDO is composed by the following items:

- **Q-CTRLX16** - one for each system: it's the controller unit for up to 16 cashiers
- **Q-RADAR** - one for each system: it detects the presence of persons waiting for a call from a cashier
- **Q-SENSX3** - one for each cashier: it detects the presence of customers at the cashier
- **Q-CTRL-R** (optional), one for each system: for settings and instant status monitoring

FLUIDO system is designed and manufactured by Dromo Elettronica Srl which is ready to give support for every request and customisation you need.  
Enjoy this Great Experience!
